The buck-boost converter is a type of DC-to-DC converter that has an output voltage magnitude that is either greater than or less than the input voltage magnitude. It is equivalent to a flyback converter using a single inductor instead of a transformer. Two different topologies are called buck-boost converter.

Buck-boost converter - Wikipedia

Boost charge Charge given to a battery to correct voltage imbalance between individual cells and to restore the battery to fully charged state. **Charge** The process of replenishing or replacing the electrical charge in a rechargeable cell or battery. **Cycle life** The number of cycles (charge/discharge) a battery provides before it is no longer usable.
