Air pollution. Internal combustion engines such as reciprocating internal combustion engines produce air pollution emissions, due to incomplete combustion of carbonaceous fuel. The main derivatives of the process are carbon dioxide CO₂, water and some soot—also called particulate matter (PM). The effects of inhaling particulate matter have been studied in humans and animals and include asthma, lung cancer, cardiovascular issues, and premature death.

Stationary Internal Combustion Engines are common combustion sources that collectively can have a significant impact on air quality and public health. They emit air toxics, volatile organic compounds and conventional air pollutants.

The first four-stroke internal combustion
engine was built by Nikolaus August Otto
in May 1876. Otto's design was based
partly on an earlier gas engine invented
by Etienne Lenoir.

They may also be released when vehicle tailpipes emit air and fuel residuals. Gasoline vapors also escape into the atmosphere during refueling and when fuel vaporizes from engines and fuel systems caused by vehicle operation or hot weather.

Don't Idle. Unnecessary idling of cars, trucks, and school buses pollutes the air, wastes fuel, and causes excess engine wear. Modern vehicles do not require "warming up" in the winter, so there is no need to turn on the engine until you are ready to drive.

Exhaust gas or flue gas is emitted as a result of the combustion of fuels such as natural gas, gasoline, petrol, biodiesel blends, diesel fuel, fuel oil, or coal. According to the type of engine, it is discharged into the atmosphere through an exhaust pipe, flue gas stack, or propelling nozzle. It often disperses downwind in a pattern called an exhaust plume. It is a major component of motor vehicle emissions, which can also include: Crankcase blow-by Evaporation of unused gasoline Motor vehicle
