In all the above situations, mass transfer occurs by just two mechanisms: diffusion, which is molecular in origin, and convection, which is bulk movement of fluid. Even a tiny element of fluid of microscopic dimension contains enormous numbers of molecules of the species at the local concentration of that element.

Introduction to Heat Exchangers

Heat transfer processes are classified into three types. The first is conduction, which is defined as transfer of heat occurring through intervening matter without bulk motion of the matter. Figure 1.1 shows the process pictorially. A solid (a block of metal, say) has one surface at a high temperature and one at a lower temperature.
