## Word Processor Wikipedia

A word processor (WP) is a device or computer program that provides for input, editing, formatting and output of text, often with some additional features. Early word processors were stand-alone devices dedicated to the function, but current word processors are word processor programs running on general purpose computers.

## Word processor - Wikipedia

From Wikipedia, the free encyclopedia A word processor is a computer program (often a text editor) or a special computer intended to edit texts with colours and different font sizes and styles, or texts which will be printed. Most such programs now have helpful instruments (tools) to make good texts.

In computing, a word is the natural unit of data used by a particular processor design. A word is a fixed-sized piece of data handled as a unit by the instruction set or the hardware of the processor. The number of bits in a word (the word size, word width, or word length) is an important characteristic of any specific processor design or computer architecture.

In linguistics, a word of a spoken language can be defined as the smallest sequence of phonemes that can be uttered in isolation with objective or practical meaning. For many languages, words also correspond to sequences of graphemes ("letters") in their standard writing systems that are delimited by spaces wider than the normal inter-letter space, or by other graphical conventions.
